

IN THE SPECIFICATION

Please amend page 59, paragraph 158 as follows:

[00158] Figure 17 illustrates one embodiment of a set of sequences of a replication site of a replication site selection protocol. The handset replication system generates a service request 1701 that is sent to the server replication system. After sending service request 1701, the handset replication system waits for a response (1710). The server replication system, in response to service request 1701, generates an indication that replication is allowed (1711), and sends a service response 1702 to the handset replication system. At a time later, the handset replication system asserts a service replicable on the handset (1712), sends a replication request 1703 to the server replication system, and waits for a response (~~1704~~1714). While the handset replication system waits for a response, the server replication system selects the handset at the replication site (1713) and generates a replication response 1704 that is sent to the handset replication system.
